Verification of Project

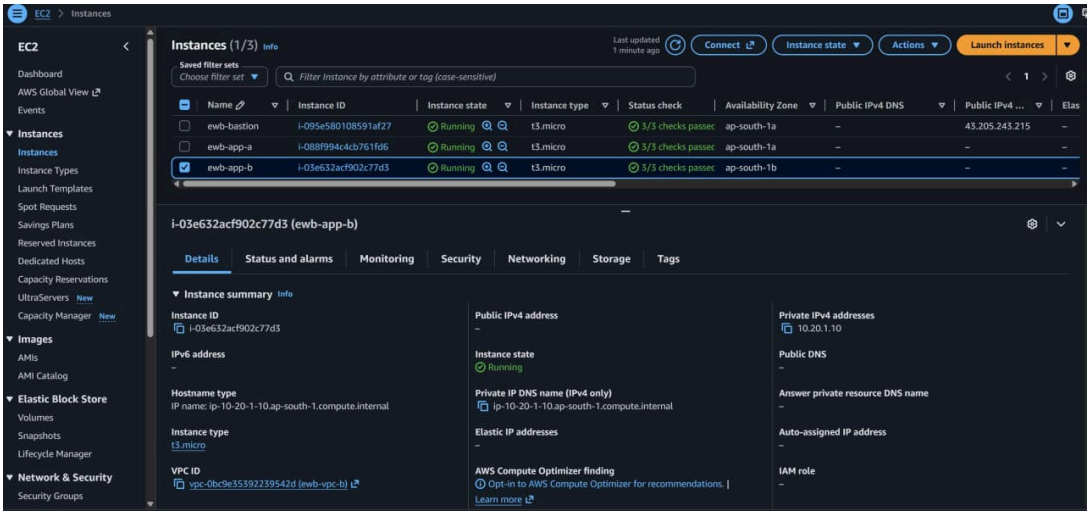

forward Connectivity Test: Verified ICMP connectivity from App-A to App-B confirming successful communication between the two VPC's through the peering connection.

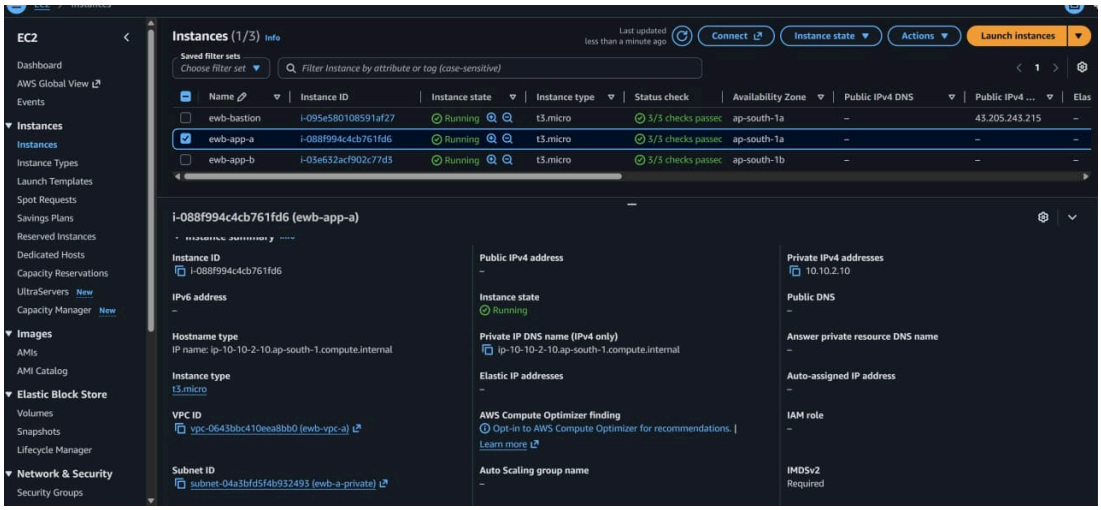

Reverse Connectivity Test: Verified ICMP connectivity from App-B to App-A confirming bidirectional private network communication.

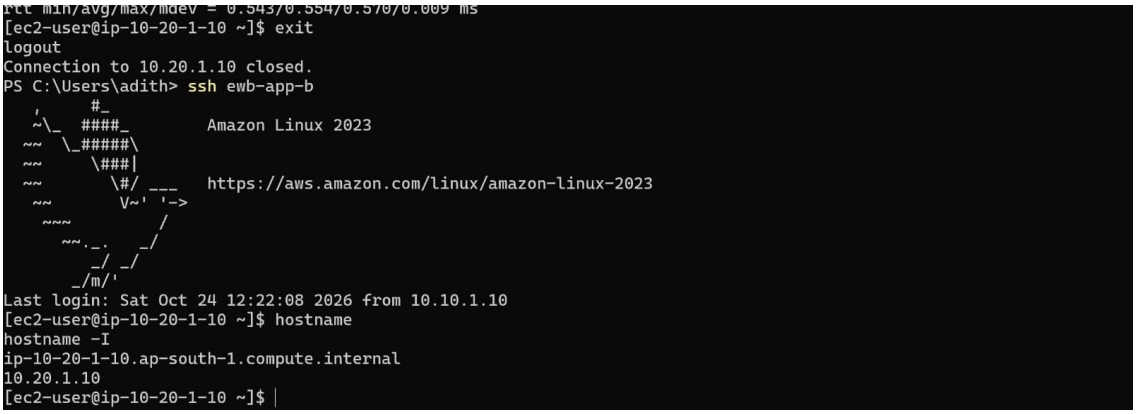

Private Network Isolation: Confirmed that App-A and App-B do not have public IPv4 addresses maintaining private access to application instances

Security Group Validation: Temporarliy remove the ICMP inbound rule on App-B and repeated the connectivity test to verify that security group rules control cross VPC traffic Restore the rule after testing

Secure SSH Access: Validated SSh access to App-B through Bastion host using SSh proxyjump without requiring direct public access to App-B
